Series Series {{ # series }} {{ name }} {{ /series }} {{ # store }} {{ name }} {{ /store }} Air conditioning units have helped society keep up and survive extremely hot weather conditions, not just in a typical summer season, but every day especially in tropical countries like the Philippines. Among the most leading brands of air conditioning units is the company called "Carrier." A Century of Innovation for the Air Conditioning Units Carrier is a trendsetter when it comes to the field of air conditioning unit manufacturing. It's also the biggest distributor of air conditioners for a century now, since its humble beginnings in 1902. The invention of modern-day air conditioning can be credited to Willis Carrier, the founder of Carrier. The company officially kicked off its business as an independent American company that manufactures and distributes ventilating, heating and air conditioning systems in 1915. Aside from that, they also produce and manufacture food servicing and refrigeration equipment. In 1920, their first event manufacturing plant was set up in Newark, New Jersey. This was built on the first-ever property that Willis Carrier, together with 6 other engineers have bought. It was in 1979 that the company became part of a bigger corporation when it was acquired by United Technologies. Groundbreaking Cooling Technology Finding the perfect air conditioning unit is not as easy as it may seem. It takes more than picking the unit that could provide sufficient horsepower to literally cool down your atmosphere. Apparently, Carrier is a brand that delivers more than just that. There are two main sections that make an air conditioning unit function: The condenser and the evaporator coil. The condenser is the part that compresses and cools the refrigerant gas. Then, the gas passes through the evaporator coil, and the air around it is cooled down further. Lastly, the air is blown out of the air conditioning unit, into the room. In the past, the gas that was used in air conditioners was Freon. However, due to its destructive effect on the ozone layer, it was slowly phased out and was replaced with Puron - an eco-friendly gas. Though it was able to fill the role of Freon, it required more pressure. Thus, the role of the innovative technology of Carrier comes into play. Carrier Air Conditioning Units stands out because of its groundbreaking compressor technology that can withstand high levels of pressure, required to run Purons. The compressor is the priciest part of an air conditioner, which is why it's very essential to buy a unit that has a durable and reliable one. Carrier's compressors are not only top-notch but also secured since every unit that they manufacture comes with a 10-year warranty. Carrier and its Product Lines Carrier offers a wide variety of cooling systems that can suit different conditions. From portable and split type air conditioning units, that you could easily set up for your home, to Industrial ones that are built with heavy-duty compressors. Currently, they have 3 main series of air conditioners, designed to cater to the kind of convenience and durability that your environment requires: Infinity Series The most superior type of air conditioning unit manufactured by Carrier. It provides the most efficient yet quietest cooling system. It's basically designed to provide your home with overall comfort. It's integrated with Carrier's innovative Infinity Control, to allow users a high degree of control when it comes to comfort management. Performance Series Quiet, Energy Efficient and Reliable. The Performance Series Air conditioners offer these 3 qualities in cooling your space, no matter how small or big it is. Aside from the traditional system found in the modern air conditioning units, this series also comes with a compact unit that could literally fit in tighter installations. It can run with minimal noise, and it has a high SEER (Seasonal Energy Efficiency Ratio) rating. Comfort Series This product line from the carrier provides the most cost-efficient air conditioning unit. It's granted with a SEER rating of 16, which can dramatically cut your utility bills. Aside from that, this type of air conditioning unit is the quietest unit in their line of products, which makes it easier on your ears. Giving you an undisturbed good night's sleep, while keeping your room as conducive for sleeping as possible. Is your air conditioning unit loud? insufficient? or simply not functioning the way it should be. Don't be short-changed anymore. Carrier is the brand that could help you get to keep your cool in the midst of scorching hot weather, without burning much heat in your electric bills. Carrier's air conditioning system is designed with precision in order to deliver without stretching your electric meter. What is a split type aircon? A split type aircon such as those from Carrier comprises an indoor and an outdoor unit. The outdoor unit for a Carrier split type aircon is usually placed near the outer wall of the room where the cooling device is installed. The outdoor unit consists of the capillary tubing, compressor, and condenser coil. Meanwhile, the indoor unit comprises a long blower, an air filter, and a cooling coil. How do you clean a Carrier Aircon? How to Clean a Carrier Aircon Start by cleaning the condenser coils and the evaporator. Make sure that the controls and electrical connections are working. Secure oil motors. Make sure that the refrigerant is at an optimal level. Check if the thermostats are working properly to ensure correct operation. Check ductwork and filters. Is Carrier a good aircon brand? Carrier is the oldest manufacturer of air conditioning systems and is considered, by many, the expert in-home comfort. Besides, Carrier is consistently ranked among the top three manufacturers in reviews of the best heating and air conditioning systems. Carrier's products are among the most efficient and affordable in general, with many of their most cost-effective models ranking high in the energy efficiency category. The company's commitment to providing the most efficient, high-quality heating and cooling systems at the most affordable prices. With literally hundreds of options, Carrier makes it simple to tailor your system to your unique indoor comfort requirements. Browse a wide variety of Carrier's home appliances such as window type air conditioners, split type air conditioners, portable air conditioners, floor mounted air conditioners and more at iPrice PH today! A powerhouse in the industry, Carrier has proven time and again that it has quality manufacturing, diverse features, and great service Kolin has long been a top brand in the local market, with both split type and window type options that are sure to satisfy any consumer. While the company has a range of different cooling products that any consumer can make use of, its split-type aircon range is particularly powerful. Panasonic offers a diverse range of electronics and appliances, each of them powerful and built to last. The brand has a range of different awards thanks to the quality of its products and services. The brand has a long history of providing incredible quality, efficiency, durability, and service to customers. That makes it more than enough reason to count among the best brands in the Philippines. LG consistently ranked as one of the most reliable appliance brands in not only the market in the Philippines but worldwide as well. Mitsubishi is recognized as one of the top brands in the industry, and with good reason: the quality and durability of its products are near unmatched. The company's strengths can be found in its split-type inverter line. Split-type inverter aircon units are a popular choice thanks to their precise temperature control and energy savings. Hitachi's air conditioners are commonly known for their quality, with their units having passed stringent world-class quality control testing. TCL is most popular in the Philippines for its portable AC units, which allow Filipinos access to faster cooling with none of the stress and commitment of wall-mounted type units. An aircon is more than just a piece of equipment — it's an appliance that is meant to last you and your family years. Buying an aircon means that you're willing to make the investment and that investment should pay off. However, that doesn't mean that aircons are all the same. In fact, it's the complete opposite: there are different types of aircons depending on your budget, room size, priorities, and room layout. Normally, you'd want to look for a cost-effective aircon unit with great fan speed and bigger cooling capacity. Some aircon units have precise temperature control that can keep an entire room at your desired temperature, though this may come at a higher price and wouldn't be an ideal choice if you're tight on budget. An aircon designed for a simple one-room condominium unit, for example, is not going to hold up to use in an office room that fits up to fifteen people. And if you're renting an apartment temporarily, you probably aren't going to invest in a complicated inverter split-type air conditioner. Determining which air conditioner to buy is also dependent on the brand. If you're going to be investing in an air conditioner that's meant to last you years, then you're going to want a brand that's durable and reliable. This means looking for brands with units that have self-diagnosis abilities for maintenance, or those brands with good warranty and service. Another thing that determines whether a brand is a good manufacturer of air conditioners is whether their products offer good value for money. Buying air conditioners is not cheap, and that doesn't just refer to the price upfront. Like all appliances, air conditioners will require regular costs in use and maintenance. And since the Philippines has one of the highest electricity rates in the region, picking an energy-efficient air conditioner is especially important. Determining whether your prospective air conditioner is energy efficient is easy. You can simply look at the units' Energy Efficiency Ratio (EER), which is often indicated on the manual or unit itself in kJ/h. This is determined by dividing an air conditioner unit's cooling capacity by its power consumption. Generally, an Energy Efficiency Ratio of 10 or higher indicates that your air conditioner unit is energy-efficient and eco-friendly. You can also look at the type of refrigerant that your air conditioner uses. Air conditioners that use an energy-saving refrigerant such as R410A are more likely to have better energy efficiency, and thus be more cost-effective and eco-friendly in the long run. If you're trying to pick out the best air conditioner brand for you, then you're going to need to figure out what type air conditioner you want to invest in. Different brands offer different type air conditioners, depending on their manufacturing capabilities, technology, and market. Consumers who want a good deal on their air conditioners have to pick brands that can manufacture these type air conditioners safely, efficiently, and reliably. Below, we have a short introduction to the different type air conditioners that are commonly available in the Philippines air conditioner market. In the Philippines, air conditioners are typically divided into three categories: window type air conditioners, split type aircons, and portable type air conditioners. Read on for a short introduction to these three different type air conditioner units. Window type air conditioner units are the most common type, and you're more likely to find them in most homes in the Philippines. These are your typical squarish, boxy type air conditioner models that are installed into windows (hence the name) or walls. A window type aircon will consist of one entire unit, with half of the unit containing the compressor located on the outer wall. Window type air conditioners can also have an inverter system, which helps increase energy efficiency. The second most popular type of air conditioning units in the Philippines is the split type air conditioner. A split type air conditioner has an outdoor unit, which contains the compressor, and an indoor unit, which contains the cooling unit. The indoor unit is connected to the outdoor unit via piping. Split type air conditioning units are known for their energy efficiency, particularly if they are inverter split type air conditioner units. An inverter split type has an inverter system that basically increases energy efficiency and lowers electricity costs. Split type aircon models are often preferred for this reason. The last type of air conditioning unit that can often be found in the Philippines is the portable air conditioner. A portable aircon is, as the name suggests, a portable indoor unit that can be moved from room to room. It comes with a long exhaust pipe that can be attached to windows to allow hot air to exit the home without compromising the unit's cooling range. This is a portable type AC that can be set up and moved with ease, which doesn't limit cold air to a single room in the home. The portable aircon is suitable for rooms that are small and can be used only in specific areas of your house or office. Picking an air conditioning unit in the Philippines basically means that you're spoiled for choice when it comes to picking your preferred aircon. Whether you're on the lookout for a window type aircon, split type aircon, inverter aircon, or portable type AC, you're pretty much guaranteed to find a unit that works for you. Below, we've put together a list of the 10 best air conditioning unit and air conditioning system brands in the Philippines. From brands that offer inverter split type units like Daikin, to reliable window type aircon unit manufacturers like Panasonic, to appliance giants like Samsung, here's a look at some of the brands with the best cooling technology on the market. We also include some of their best air conditioning units for a better look at what they have to offer.
